The material of the member must be homogeneous and linearly elastic. iii. The torque T is applied at the ends of the member and no additional torque is applied between sections A and B . Also, sections A and B are remote from the member ends. iv. The angle of twist at any cross section of the member is small.

solution depends on a general three-dimensional study in the theory of elasticity (or plasticity). For thin-wall cylinders, the stress near the end cap junctions may be estimated by the procedure outlined in Section 10.7 (see Problem 10.49). Consequently, the solution presented in this chapter for thick-wall cylinders is applied
