Monitoring and Controlling of PLC based Automation System ...

PLC is an industrial computer that monitors inputs, makes decisions based on its program and controls outputs to automate a process or machine. A PLC has a built-in operating system(OS).

This OS is highly specialized to handle incoming events in real-time, or at the time of their occurrence.

PLC modem is based on the Direct Sequence Spread Spectrum Technology, which ensures high noise immunity and reliable communication. The Sunrom PLC Modem provide bi-directional half- duplex data communication over the mains of any voltage up to 250v a. c., and for frequency of 50 or 60 Hz. It

PLCs in substation automation. Reliability, a large installed base, extensive support resources and low costs are some of the benefits of using PLCs as a basis for substation automation and SCADA systems. PLCs are extremely reliable. They have been developed for application in harsh industrial environments.

PLC AND SCADA BASED DISTRIBUTION AND SUBSTATION AUTOMATION

The paper Automation presents the use of SCADA (Supervisory Control and Data Acquisition) and PLC (programmable logic controller) in substation for the purpose of automation. At the substation the power is managed between the generator set and the main incomer supply. In the power management, the control

Today power system operation is becoming more and more dynamic - which requires flexible, tailored solutions for reliable operation and efficient project management. The comprehensive SICAM portfolio offers network operators and utilities everything they need for future-proof substation automation - anywhere in the world.

We manufacture advanced technology based Programmable Logic Controller System (PLC) and Supervisory Control & Data Acquisition (SCADA) based industrial automation systems. These systems are in compliance with various industrial standards and are used in machines manufactured at our end.

Programmable Logic Controller, PLC Automation Systems ...

With the introduction of personal computers (PC) in 1980s, industrial automation was revolutionised. Industrial Automation is the use of automated control devices such as Programmable logic Controller (PLC), Computer Numerical Control (CNC), Remote Terminal Unit (RTU) etc to control industrial processes and machinery in place of labour intervention and dangerous

Industrial Automation using SCADA, HMI & PLC | Overview
The driving force for the PLC and PLC-based PAC market in automation is, as it is for several devices, the digitalization of the automation business. Call it Industrial Internet of Things (Industrial IoT) or Industry 4.0, most of the approaches arise from the consumer goods markets, e.g., multi-touch, cloud, or edge computing.

In a substation, a PLC collects all the input parameters, and with the help of the communication devices, such as GSM/GPRS modem, it transfers the data to remote devices like mobiles, PCs, etc. If any electrical fault occurs, the PLC automatically trips the relays and the circuit breakers.

PLC BASED SUBSTATION AUTOMATION AND SCADA SYSTEMS And ...

Energy received in the field is measured by another energy meter. The measured energy of the substation and field are communicated to PLC and monitored by SCADA. Based on the difference in energy PLC actuates the switching devices in the substation. The purpose of the project is automate a substation.
