Using matrix notation, the constraints can be written as $Ax \leq b$ and $x \geq 0$. The feasible set is the set $F = \{x \in \mathbb{R}^n : Ax \leq b, x \geq 0\}$. Since the objective is to maximize $f(x)$, the function $f(x)$ is called the objective function. A nonstandard linear program allows other types of inequalities for the constraints.

Jan A. Snyman, Practical Mathematical Optimization: An ... mathematics (outside of teaching or academia), your best bet is applied mathematics with computers. Mathematical optimization is a powerful career option within applied math. If you're not interested in a career in mathematics, you will probably run into optimization problems anyway.

Practical Mathematical Optimization by Jan Snyman (ebook) Mathematical optimization (previously known as mathematical programming), is a branch of applied mathematics with more than half a century history. Being an area where the theory and abundant and elegant applications, it has been called the queen of applied mathematics.
